Depression

Why Alpha-Stim

Clinical Research

Alpha-Stim?

Is there clinical research on

pain and mental health solution for over

40 years and has more research than any other therapeutic MET or CES device.

There are over 100 studies published to

date, with additional studies currently underway. Our research is so good even

broad range of waveform parameters for

the CES category, which is not unusual.

For example, both aspirin and morphine

are categorized as analgesics but we all

understand the considerable differences between the two. Only Alpha-Stim is

proven to get the results shown in Alpha-

When to consider cranial electrotherapy stimulation for patients with PTSD

Current Psychiatry. 2017 February;16(2):27-28

Individuals with posttraumatic stress disorder (PTSD) often report cognitive and sleep disturbances, such as insomnia and poor concentration. Although many patients report improvement with traditional evidence-based treatments, such as pharmacotherapy and psychotherapy, it might be valuable to consider complementary or alternative therapies. Many patients seek treatments that they can self-administer as needed, at their convenience, particularly during symptom exacerbation. One treatment option is crania electrotherapy stimulation (CES).

As a medical device. CES has been cleared—rather than approved, as is the case for medications—by the FDA to treat depres insomnia, and anxiety. In the United States, CES devices require a prescription from a licensed health care practitioner, but they are available without a prescription in other countries. Cost for devices range from \$600 to \$1,200 and \$10 to \$20 for electrodes and contact solution. However, insurance companies that provide coverage for durable medical equipment might cover some or all of this expense

How CES works

After applying contact solution, depending on the device used, the user attaches electrodes to the earlobes, mastoid processes, or other parts of the head that deliver a pulsed current, usually from AA batteries for 20 to 60 minutes. ¹ The current causes cortical deactivation and could affect emotional regulation by influencing neurotransmission in the thalamus, hypothalamus, and limbic system. 1,2 CES increases cerebrospinal fluid levels of beta-endorphin, adrenocorticotropic hormone, and serotonin, which play a role

There are no known contraindications for CES. Adverse effects are rare, temporary, and mild; skin irritation, vertigo, or headache are the most common.

Evidence of efficacy

There are no double-blind placebo-controlled trials evaluating the efficacy of CES for PTSD. However, there is a case series and a large survey of patients supporting its use.

- · In a case series, 2 patients reported improved occupational functioning and reduced PTSD symptoms after using CES, 100 to 500 mA, 20 to 60 minutes a day, 3 to 5 days per week. $\!\!^4$
- In an online survey of 145 veterans and active-duty military personnel, 60% of individuals used CES for PTSD, and 20% of those individuals were not receiving pharmacotherapy. Participants reported at least a 25% reduction in symptoms using CES for at least 20 minutes, once or twice daily, with a current of 100 to 600 $\mbox{mA.}^{5}$
- In an expert opinion, patients noted improved sleep quality and reduced alcohol and drug withdrawal symptoms after 20-minute treatments, twice a day, with a current of 2 mA. Currents could be increased to 4 mA, if there was no improvement after 2 weeks.6

Some patients experiencing exacerbation of PTSD symptoms could benefit from using the device for 1 hour several times a day until symptoms subside.

Optimal strength, frequency, and duration of treatment vary among patients, and further studies are needed to assess these parameters as well as efficacy because definitive studies are currently lacking. CES has not always shown efficacy, such as in some patients with depression 7 Despite the limited evidence base it is reasonable to consider CES for patients with PTSD. This modality might be helpful for patients who have comorbid pain, anxiety, and insomnia, or for those who seek a complementary, convenient, safe, self-administered treatment.
